# Where should delivery teams act?

Olist operating review | Historical purchase cohorts through 2018-08-31

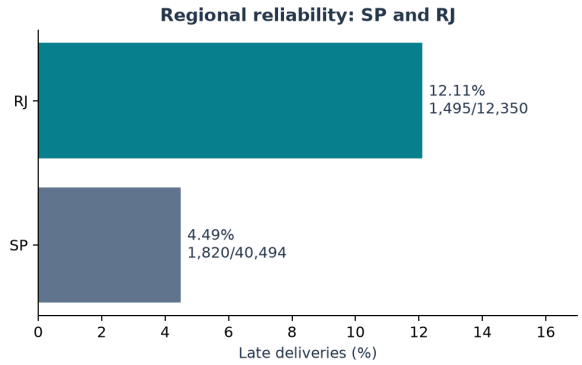

96,478 delivered orders | BRL 13.22M merchandise value | Observational analysis

## 1 Seller handoff

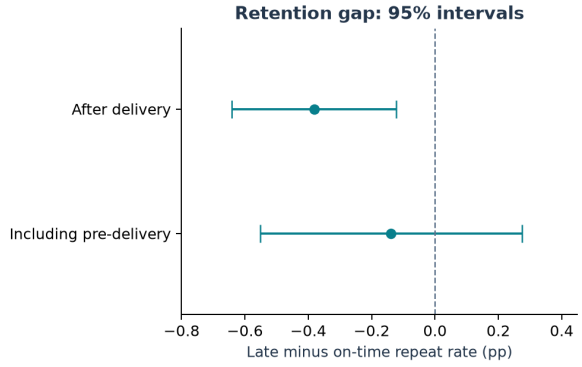

Late handoff is 9.2% of eligible orders but 27.9% of late orders. Its late-delivery rate is 3.81x the timely group.

## 2 Regional delivery

RJ: 12.11% late versus SP: 4.49%. Standardizing non-RJ distance-band rates to 12,005 eligible RJ orders gives a comparison of 827 fewer late orders.

## 3 Retention sensitivity

Equal follow-up: 37/4,835 late customers repeated versus 704/61,376 on time. The broader definition includes a longer exposure window and its interval crosses zero.

## Actions to validate

1. Audit late handoffs and carrier tracking events before assigning responsibility.
2. Compare RJ routes, delivery promises and order mix within distance bands.
3. Test service recovery with a randomized holdout and a fixed 90-day outcome.

**Limits:** Handoff and distance are proxies. Scenarios are not avoidable orders or upper bounds. Retention intervals use an independent-proportion normal approximation. The late-delivery primary group has relatively few repeat events. No business uplift or manual time saving has been measured.
